AI-CHEQUE PROCESSING

ChequeIQ

Measurable, explainable, human-in-the-loop

Shivang Jindal · AI Product Manager

The problem

Branch scanner	`itemAmount: "0000125000"`
ATM network	`amt_cents: 125000`
Mobile app	`check.amount: "1,250.00"`
Lockbox vendor	`Amt: $1,250.00`
Correspondent bank	`minorUnits: 125000`

The same $1,250 cheque, five different formats

- **Exceptions fixed by hand**
- **Slow, so clearing cutoffs get missed**
- **No one can say how accurate the automation is**

The solution

Standardise every source, let AI read the cheque, let rules decide, and send only exceptions to people.

Normalise

Many formats become one standard record

Read with AI

Every field comes with a confidence score

Decide with rules

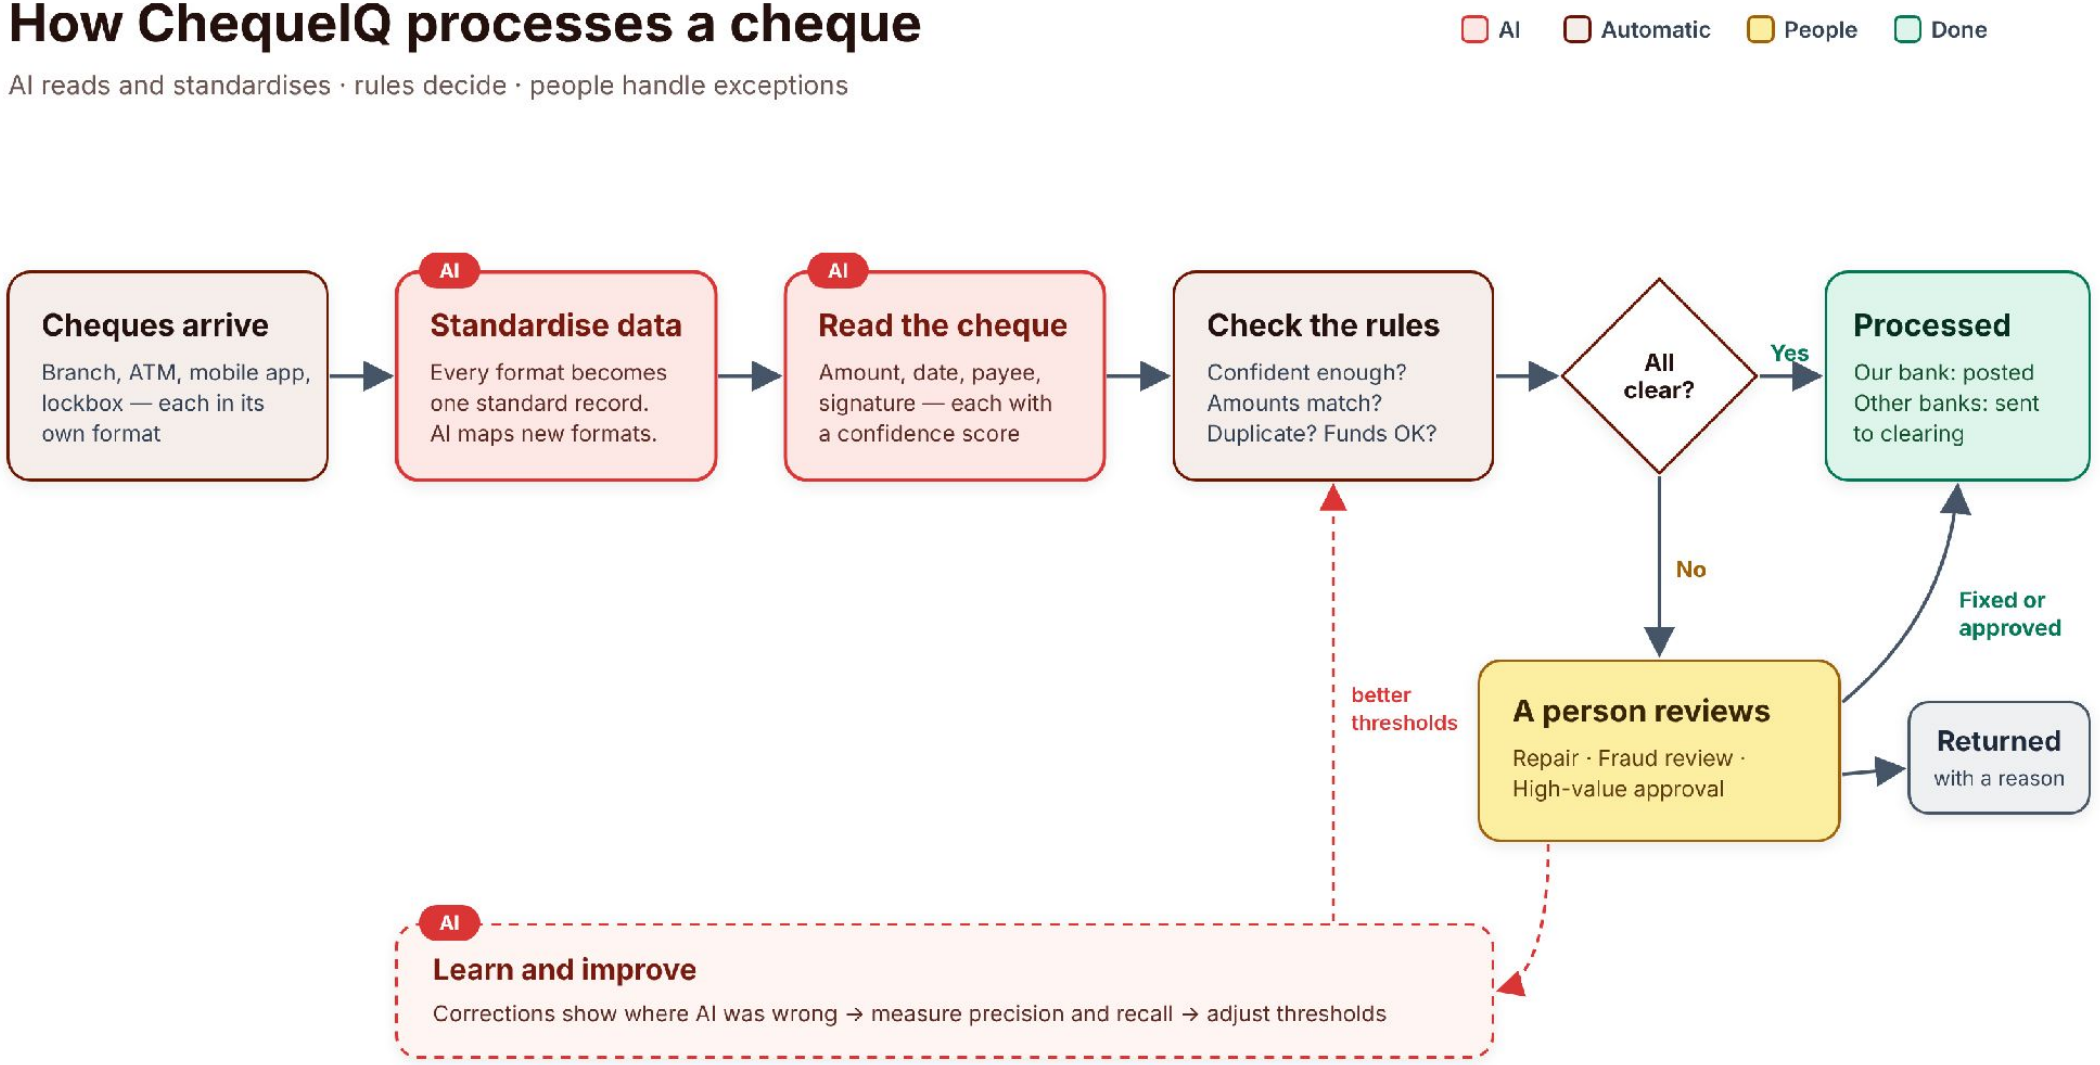

Post, send to clearing, or route to a person

Measure

Precision and recall against verified data

How ChequeIQ processes a cheque

AI reads and standardises · rules decide · people handle exceptions

How I designed the AI

AI reads, rules decide

Money decisions stay deterministic and auditable

Confidence on every field

The bank sets a threshold per field

Measured, not assumed

Precision and recall against a golden set

An explicit tradeoff

More automation or fewer errors, changed only with approval

Built for failure

Semantic traps, drift detection, retries and fallbacks

Efficient by design

AI maps a format once; code runs it on every cheque

How we measure success

North star: correct straight-through rate, cheques processed with no human touch **and** no error

60% → 85%	**≤ 1 in 10,000**	**≥ 99.5%**
Straight-through processing	Silent errors	Fraud and duplicate recall
−40%	**≥ 99%**	**< 1 week**
Handle time per exception	Same-day clearing	New source onboarding

Example targets, set per bank against its baseline · Guardrail: never trade fraud recall or silent errors for automation

Thank you for your attention
